Typography & hierarchy

Portfolio workspace

Numbers should line up.

₹1,24,500.00 +₹5,500

Nimbus Sans Narrow gives headings their terminal character. Nimbus Sans handles labels and reading. Nimbus Mono aligns prices, quantities and timestamps.

PROPOSED IMPLEMENTATION SCALE

Headings 24-32px • Body 14-16px • Dense metadata 11-12px. Use 4-6px radii, 1px dividers and an 8px spacing rhythm.

Controls & semantic colors

Primary action | Secondary action | Virtual only

FOCUSED INPUT

Search instruments…

Filled | Delayed | Unavailable

Orange signals navigation and action. Green/red indicate positive/negative values, always with a sign or text label. Use neutral gray for unavailable data; never substitute zero.

Keep contrast readable on every dark surface. Show keyboard focus without relying on animation.

DESIGN Treat the reference as a coherent system, not just a dark background with orange buttons.

BEHAVIOR The PDF embeds its preview fonts. Use approved equivalents and check font licensing before bundling.

One workspace. Clear routes.

Application anatomy and navigation for all FinEx modules.

Understand your investment horizon

Question 2 of 4 in this illustrative layout. Use the approved questionnaire in production.

01 Basics | 02 Time horizon | 03 Capacity | 04 Review

When might you need this money?

- ○ Less than 1 year
- ○ 1-3 years
- ● 3-5 years
- ○ More than 5 years

Back

Continue

Why we ask

Your time horizon helps explain how investment risk relates to your plans. It is only one part of your profile.

You can go back and revise an answer before confirming your profile.

DESIGN Keep the dark terminal shell, but reduce density for the questionnaire. One decision at a time.

BEHAVIOR Save answers across Back/Continue. Field errors identify the unanswered question without clearing progress.

Your risk profile

Illustrated result: actual scoring uses approved deterministic rules.

Profile summary

Illustrative result

Moderate

Willingness to take risk and capacity to absorb loss are evaluated separately.

Review your answers →

No return is guaranteed.

What influenced the result

01 **Time horizon**

Selected answer: 3-5 years in this example.

02 **Willingness to take risk**

Explain the approved response factors in plain language.

03 **Capacity to absorb loss**

Keep financial capacity separate from risk preference.

View scoring details

Confirm profile

DESIGN Explain the category. Avoid an invented precision score or a decorative speedometer.

BEHAVIOR The AI can explain a result; it must not change scores, thresholds or the approved questionnaire.

Ask FinEx

Explain the data. Inspect the evidence. Keep the next action under your control.

Which holding is the largest in my portfolio?

FINEX ASSISTANT

TCS is your largest holding.

In this illustrated portfolio, TCS is valued at ₹36,000. That is 36.2% of invested holdings worth ₹99,500. Cash is excluded. [1]

This describes concentration; it is not a recommendation to buy or sell.

[1] Open holdings snapshot

Ask a follow-up question… Send

Evidence

01 / PORTFOLIO SNAPSHOT

TCS: ₹36,000

Holdings: ₹99,500

36,000 ÷ 99,500 = 36.2%

Production evidence includes snapshot ID, valuation timestamp, source and freshness.

Illustrative evidence

DESIGN Use a practical answer panel with a permanent evidence column. Keep AI branding restrained and functional.

BEHAVIOR The assistant never invents prices, balances or citations. It does not place orders from a conversation.

Document evidence & source reading

Home Markets Ask More

DESIGN Keep the same charcoal palette, condensed headings, orange selection and signed market values.

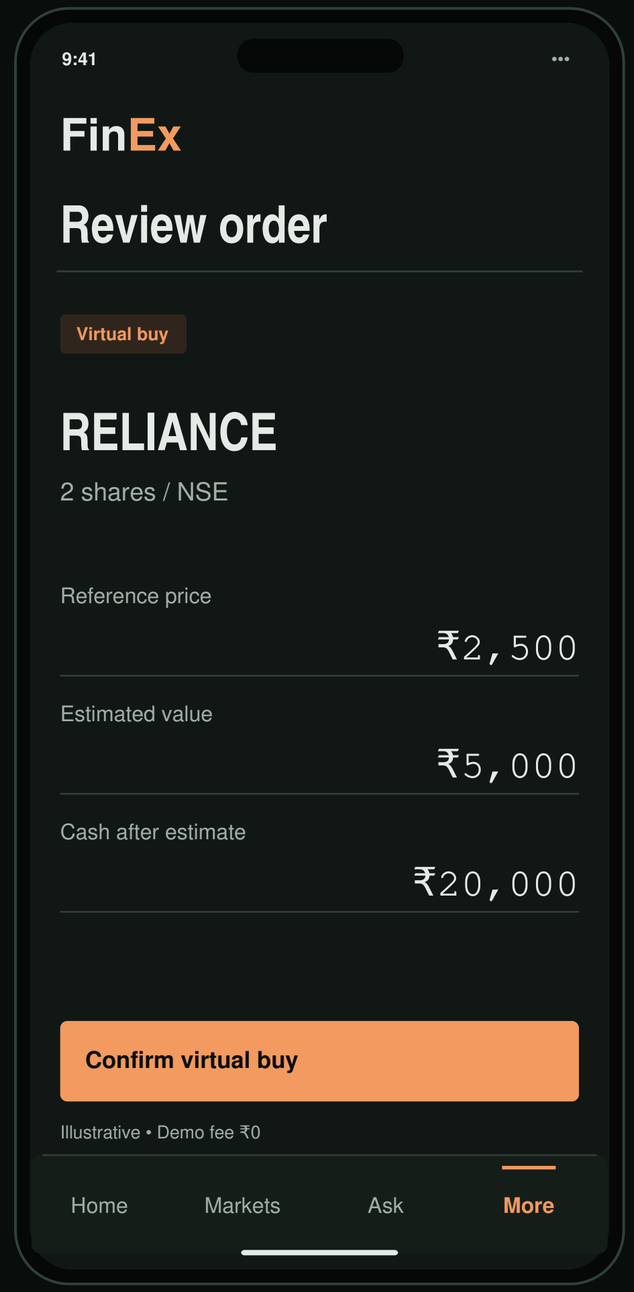

BEHAVIOR Convert desktop tables into labelled rows. Charts retain units and time labels; never squeeze desktop columns.

Mobile portfolio, AI & trading

The dense desktop flows become focused vertical tasks.

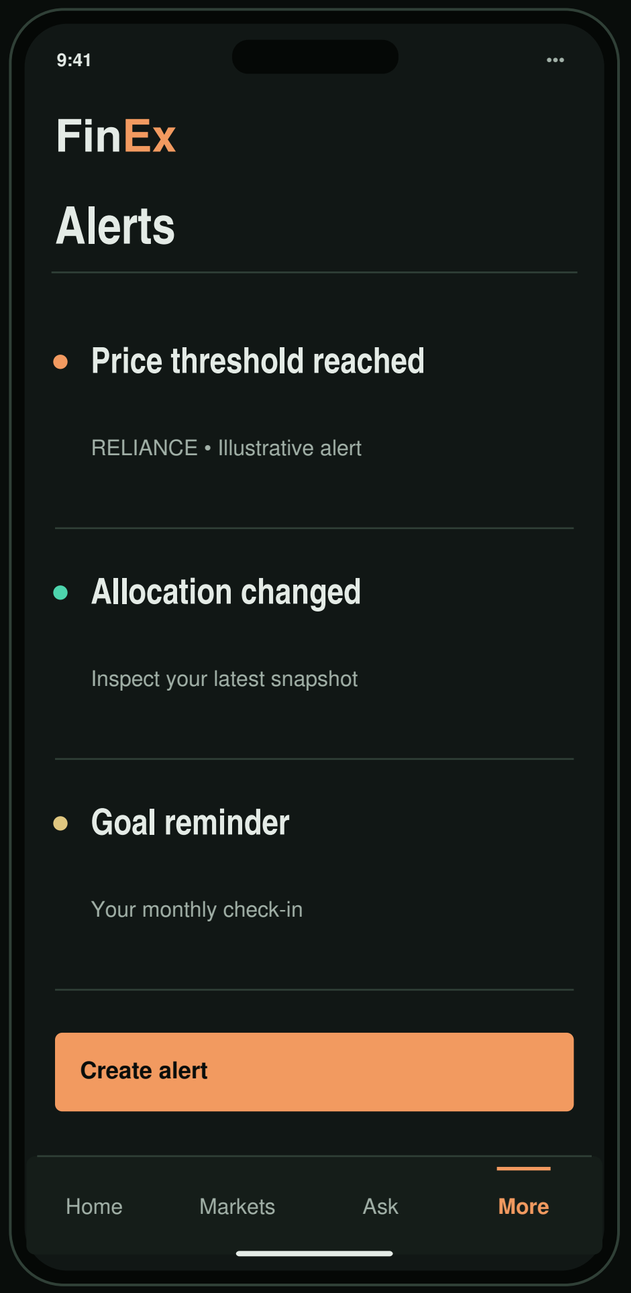

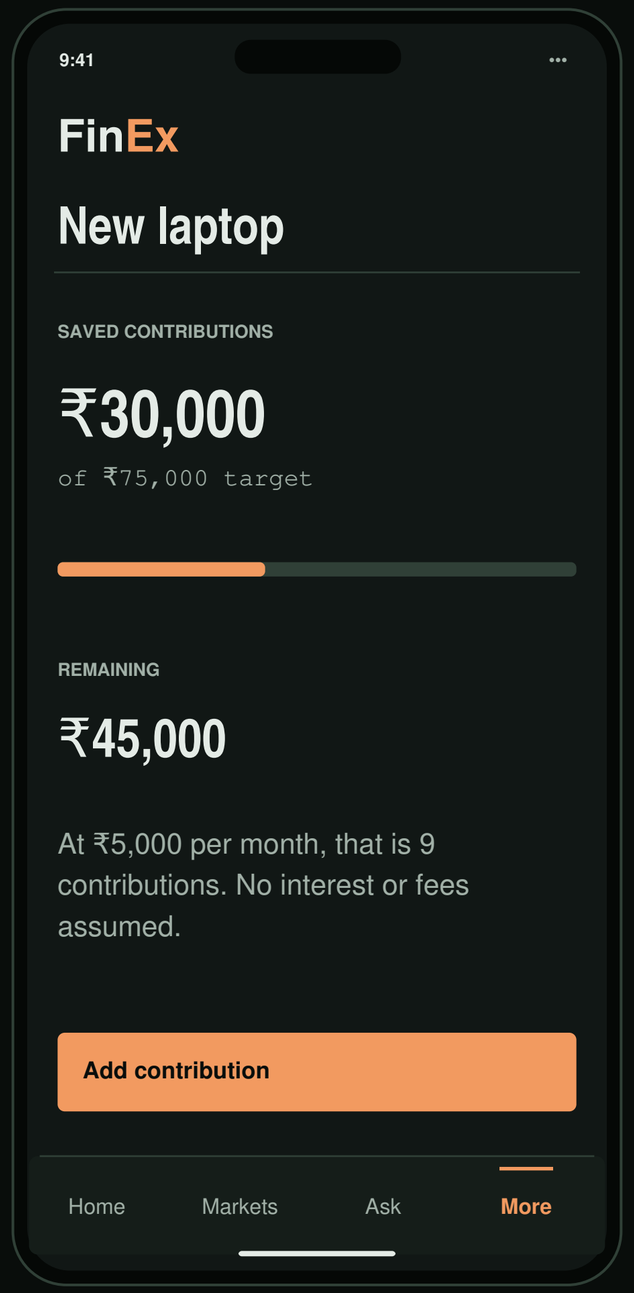

DESIGN Expose the same evidence and confirmation steps on mobile. The smaller screen must not remove important context.

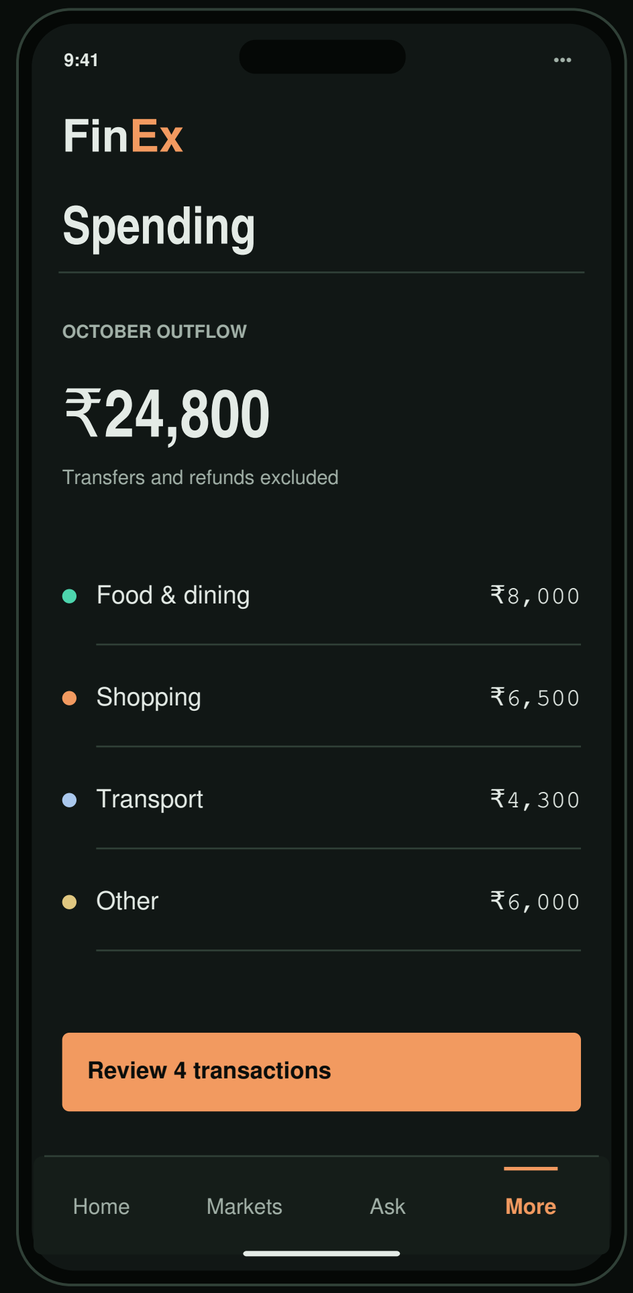

BEHAVIOR Use an evidence sheet for citations. Order confirmation remains a dedicated step with visible quantity and amount.

Mobile alerts, goals & spending

Personal-finance tools inherit the terminal identity.

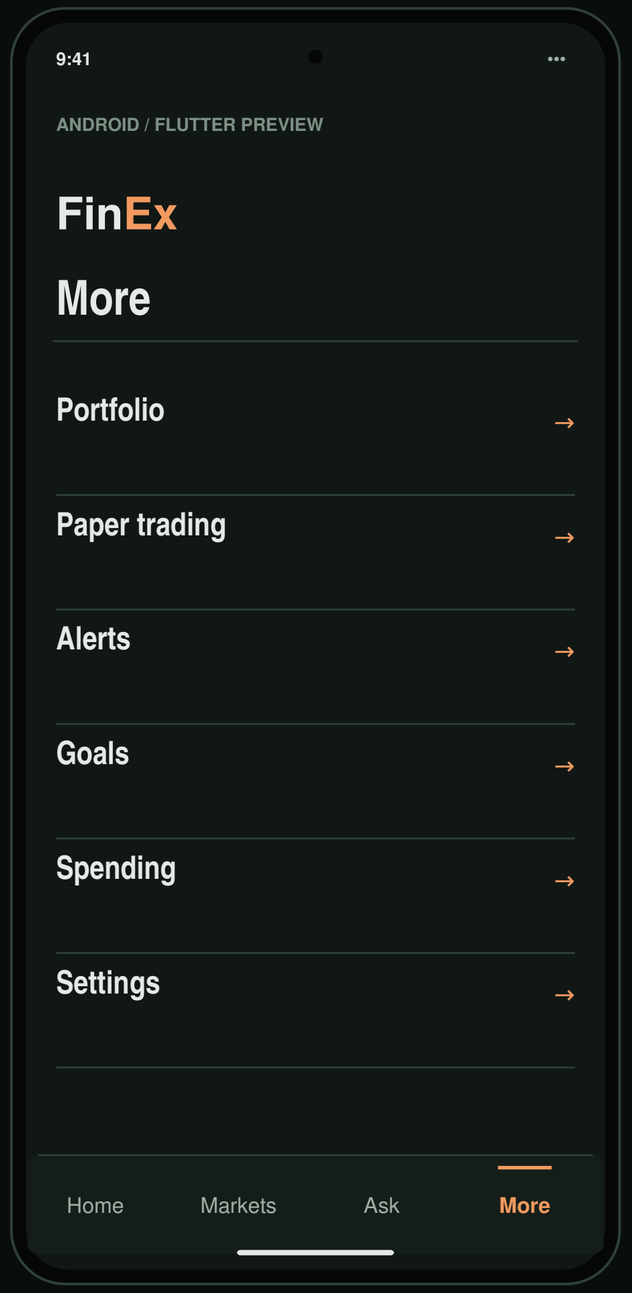

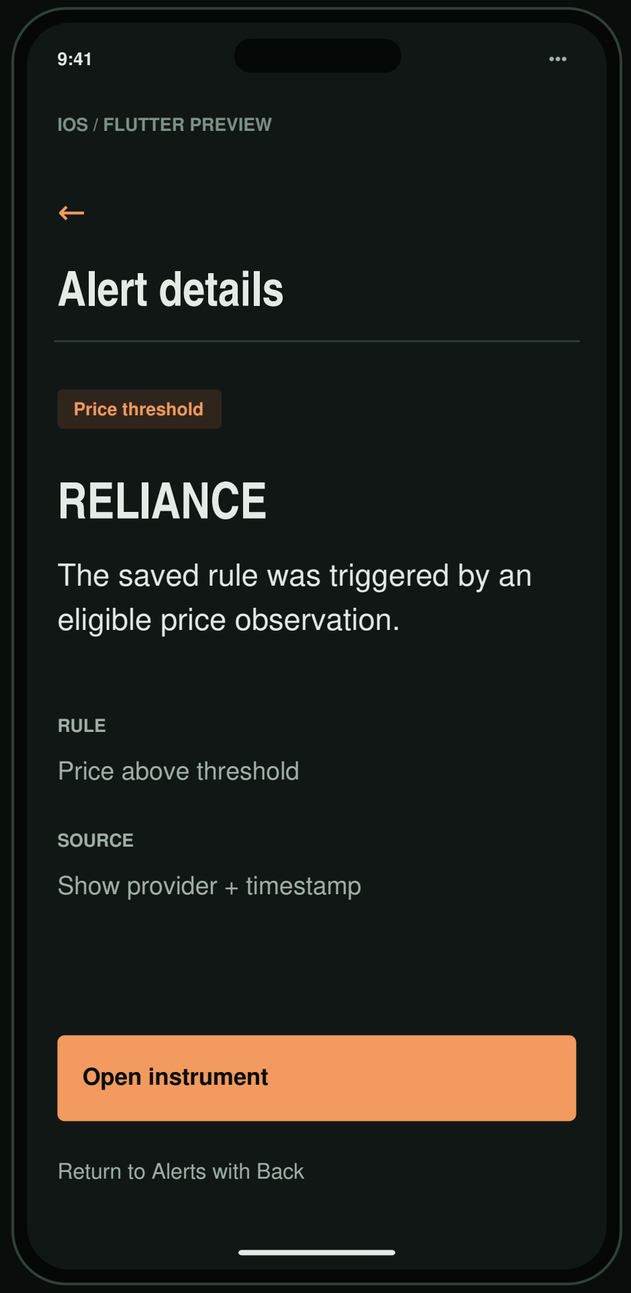

DESIGN Progress and spending keep the same restrained colors as the rest of FinEx. No separate visual theme is introduced.

BEHAVIOR Respect safe areas, keyboard insets and text scaling. Bottom navigation never covers an important action.

Flutter navigation & the More hub

Shared Android/iOS journeys, with platform-aware Back behavior.

Flutter flow & behavior

Four stable destinations

Home, Markets, Ask and More form the root navigation. More contains the remaining product modules.

Detail routes

Keep a clear Back path to the originating list or tab. A detail page does not need the root tab bar.

Notification entry

Opening an alert must verify the session and ownership before loading its linked instrument, order or goal.

Platform behavior [F2]

Use appropriate Android Back and iOS navigation behavior. The frames are illustrative; every flow serves both platforms.

DESIGN This is a Flutter application flow, with its own navigation and screen states, not a desktop page reduced to phone width.

BEHAVIOR Preserve the selected tab and list position on return. Refresh protected data when the app resumes.

Flutter sign-in & session recovery

Welcome / consent / Google sign-in / expired session

If you were checking an order, FinEx will check that order after sign-in.

Continue with Google

Flutter flow & behavior

Consent first

Continue stays disabled until required consent is accepted. Link to readable policies inside an appropriate document view.

Session ownership

Use the existing backend identity flow. Do not invent a separate Flutter user database or accept client-side ownership claims.

Cancelled sign-in

Return to the welcome screen with a clear retry action. Never show a signed-in state before the backend validates the session.

Safe recovery

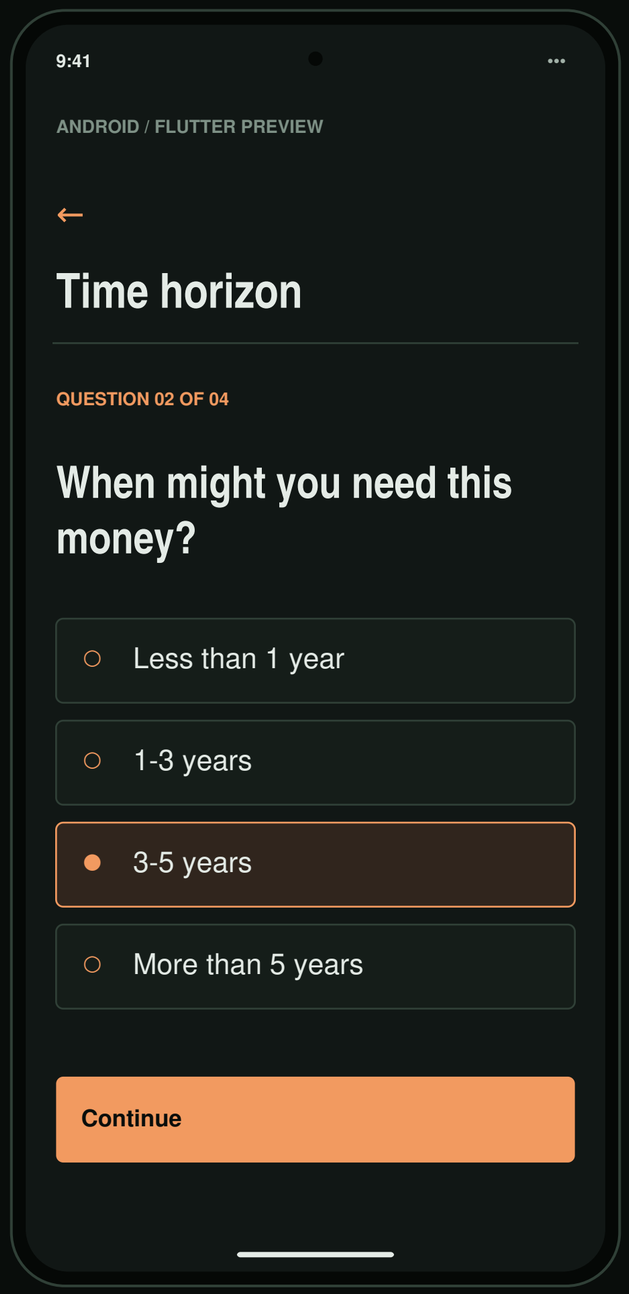

Preserve the intended destination. Clear another user's sensitive cached data on sign-out or account change.

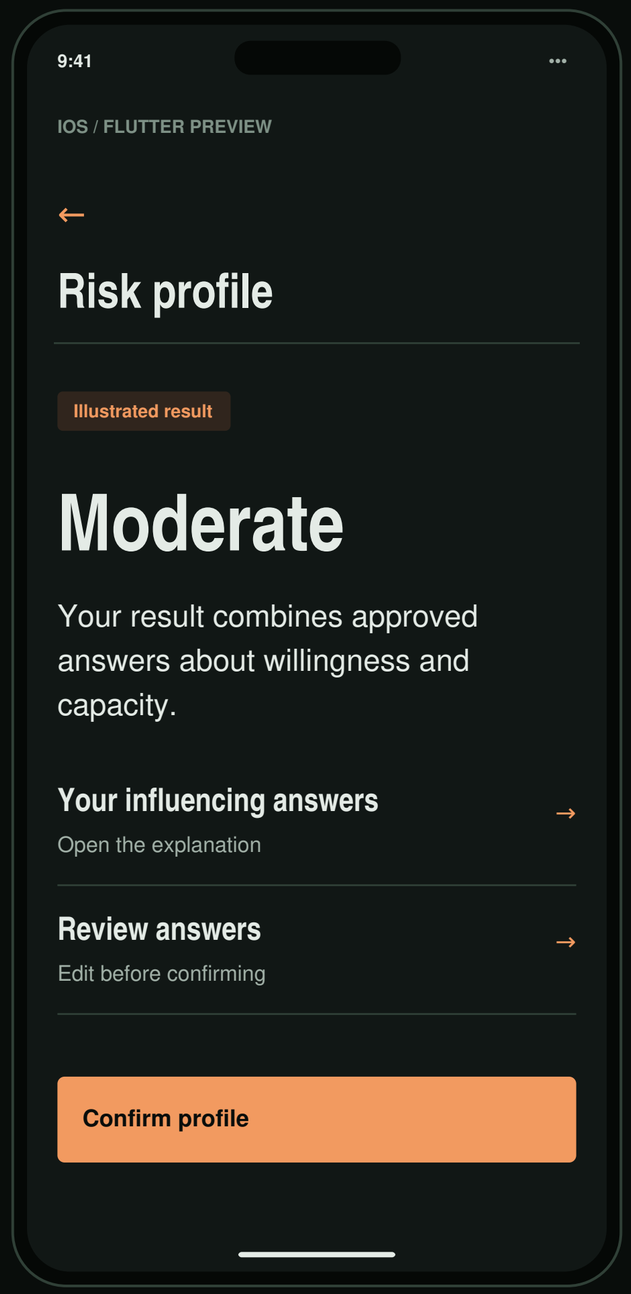

DESIGN Match the Graphite identity at the app entry point and make session recovery understandable.

BEHAVIOR Do not retry a financial action automatically after re-authentication. Recover its existing status first.

Flutter onboarding & risk result

Saved answers / single-choice question / explainable result

Flutter flow & behavior

Keep progress

Restore saved answers when navigating Back. Explain the exact field or question that needs attention.

Approved rules

Use the questionnaire and deterministic score returned by FastAPI. Do not calculate a different mobile risk category.

Explain the result

Separate willingness from capacity. Keep influencing responses accessible and show the relevant version in details.

Completion gate

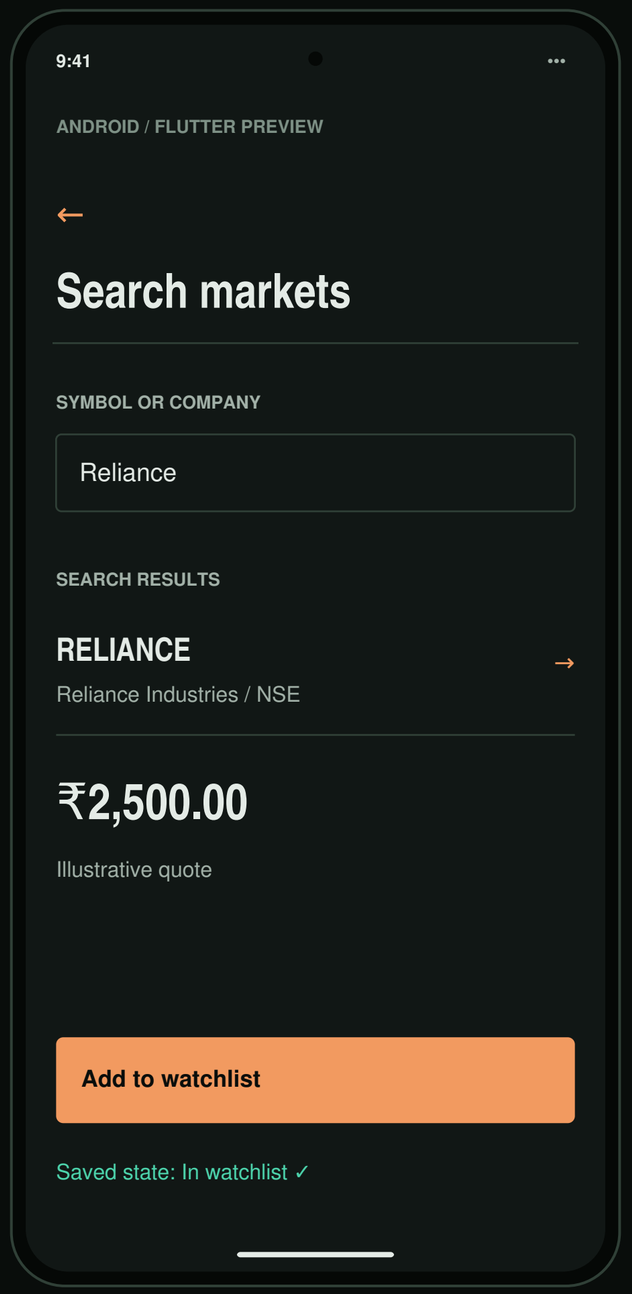

Save confirmation before opening the signed-in workspace. A failed save must remain visible with a retry option.

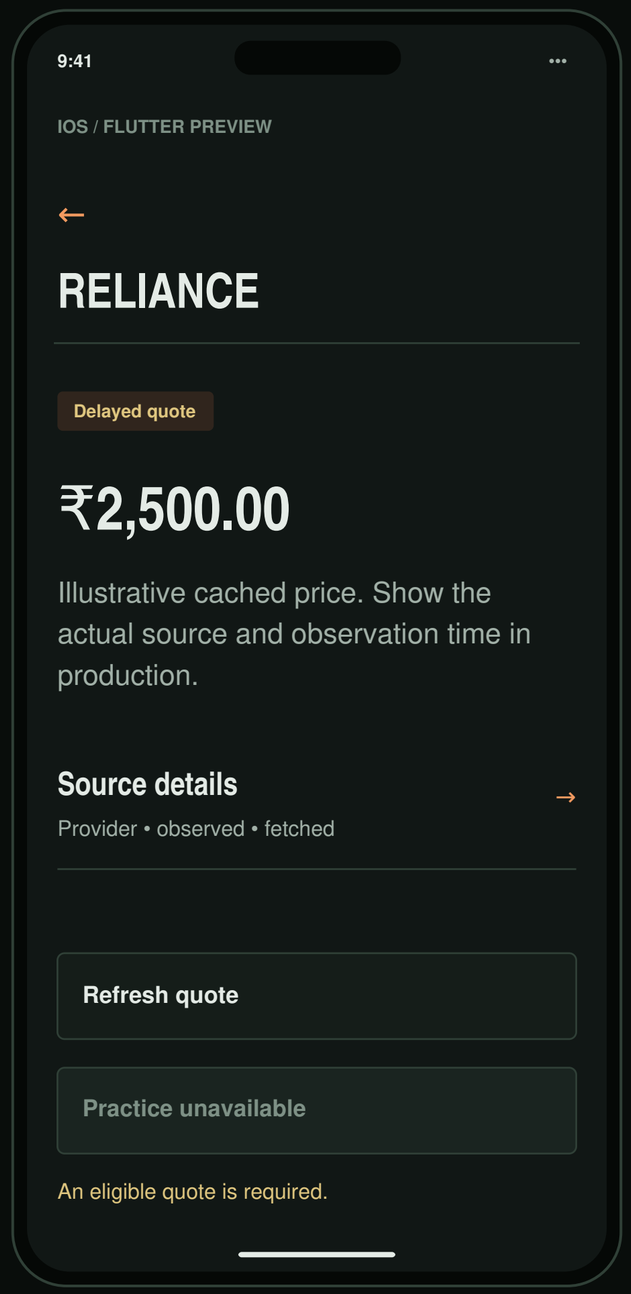

DESIGN The mobile flow contains the same questions, consent meaning and deterministic outcome as React.

BEHAVIOR Support larger text without cutting off answers. Keep Back available and preserve progress when the keyboard is dismissed.

Flutter search, watchlist & quote states

Instrument discovery / adding a symbol / stale-data treatment

Flutter flow & behavior

Search behavior

Debounce input, cancel stale requests and show loading, no-match and retry states. Keep a predictable result order.

Watchlist updates

Show saved membership immediately only if confirmed or with a recoverable pending state. Prevent duplicate additions.

Honest freshness

Cached, delayed and unavailable are distinct. Show observation time separately from retrieval time.

Action eligibility

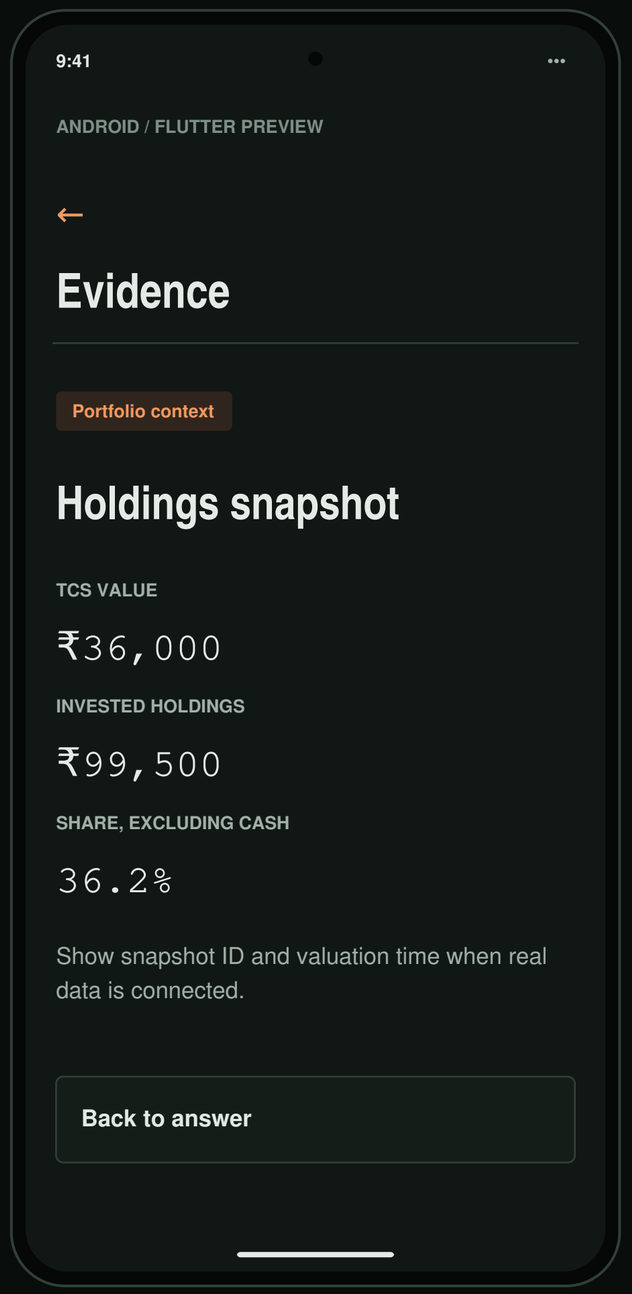

Use backend quote eligibility before enabling a virtual order. Refreshing a quote must not submit a trade.

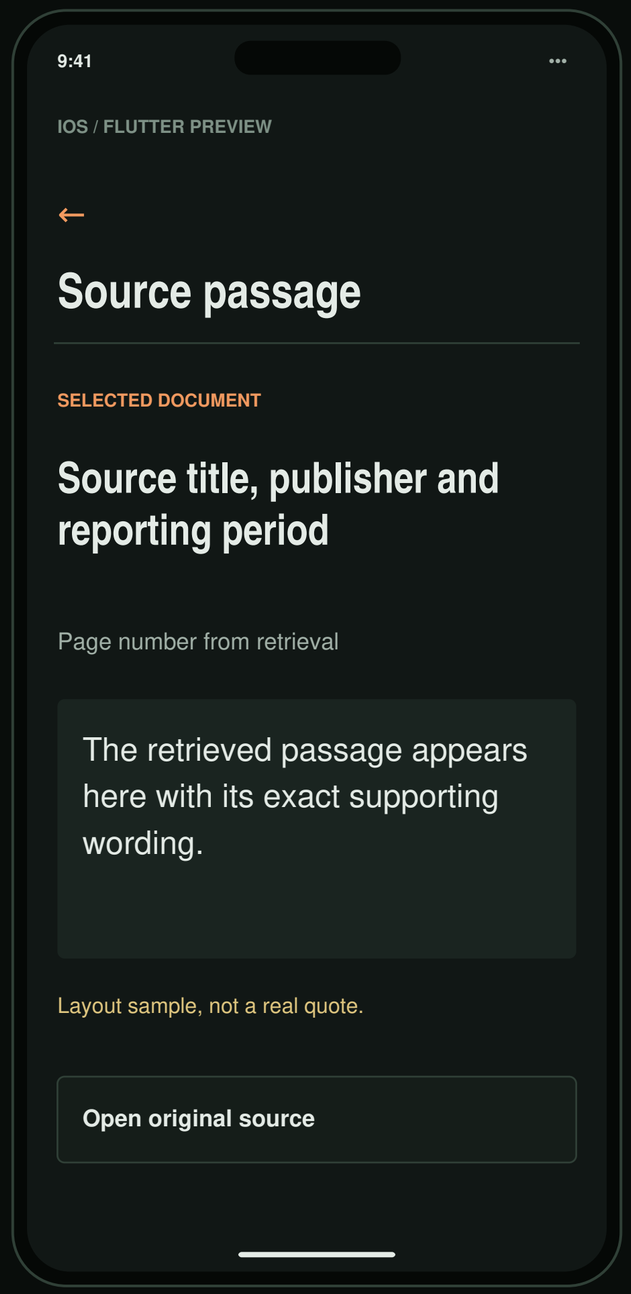

DESIGN The Flutter quote screen gives timestamps and eligibility the same priority as the chart.

BEHAVIOR Do not request unnecessary device permissions for market search or watchlist access.

Flutter AI evidence & source reading

Context sheet / source passage / original document

Flutter flow & behavior

Context remains visible

A user should know whether the answer used a portfolio, a document or both. Preserve the conversation when closing evidence.

Document reading

Show source metadata and page. Highlight the retrieved passage without rewriting it into an invented quote.

Missing evidence

State that the answer cannot be verified. Offer a narrower question or an available document rather than filling the gap.

Safe rendering

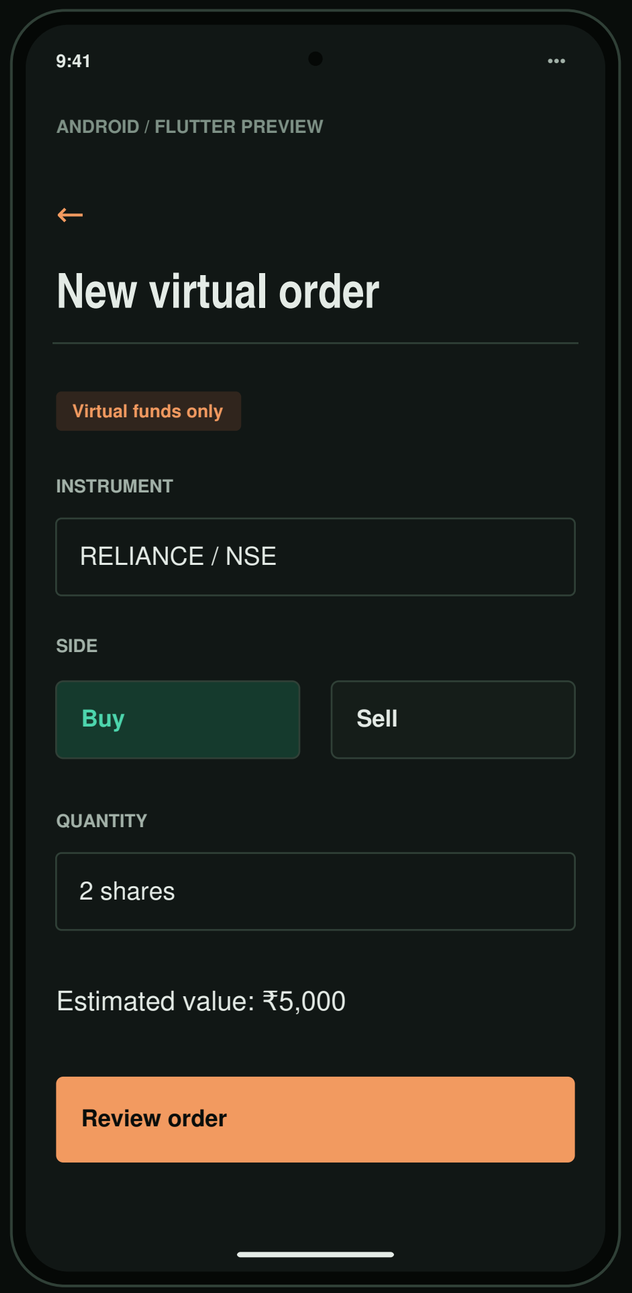

Treat source text as content, not instructions. Do not expose another user’s portfolio, spending records or chat history.

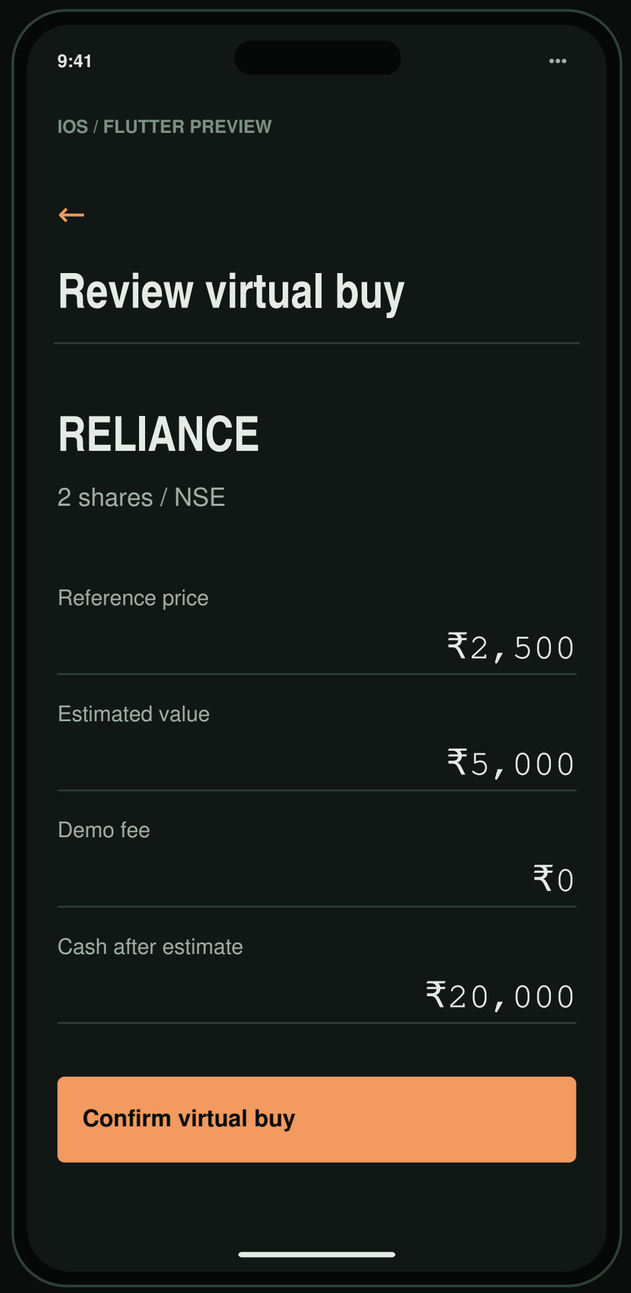

DESIGN A bottom sheet can summarize evidence; a full screen gives a longer source passage room to be read.

BEHAVIOR Links open the actual approved source. Returning to chat restores the same answer and scroll position.

Flutter paper-order entry & review

Input / cash estimate / confirmation / virtual-account label

Flutter flow & behavior

Input validation

Use the appropriate quantity keyboard and validate against backend rules. Explain invalid amounts and insufficient cash inline.

Estimates are labelled

Use eligible reference prices. Show the fee assumption and distinction between estimated and final execution values.

One explicit confirmation

Confirm submits once and shows a pending state. Persist the request identity long enough to reconcile a lost response.

No automatic repeat

App resume, network retry or double-tap must not create another order. Never place real-money orders from this prototype.

DESIGN The Flutter flow has the same review boundary as the website. Dense financial details become labelled vertical rows.

BEHAVIOR The example fee is zero only for this mockup. Implement the approved production fee and price rules.

Flutter order status & recovery

Unknown response / reconciliation / persistent receipt

9:41

ANDROID / FLUTTER PREVIEW

←

Checking order

Status unknown

Do not submit again.

We are checking the result of your existing virtual order.

ORDER REFERENCE

DEMO-ORDER-001

A network timeout does not mean the order failed.

FILLED VALUE

₹5,000.00

DEMO ORDER ID

DEMO-ORDER-001

Open order activity

Flutter flow & behavior

Status vocabulary

Pending, filled, rejected and unknown have different meanings. Use text and icons as well as color.

App interruption

When the app resumes, request the status of the existing order. Rebuild the screen from the authoritative result.

Rejected order

Show the backend reason and a deliberate Edit action. A rejection does not silently change quantity or funding.

Receipt retention

The user can reopen the receipt and cash-ledger entry. Include actual timestamps, fill values and a persistent identifier.

DESIGN Mobile backgrounding and network loss are expected parts of a trading flow. Design recovery before adding animation.

BEHAVIOR Prevent duplicate actions while a result is unknown and show the last successful status check when available.

Flutter alert creation & notification permissions

Trigger form / delivery preference / permission recovery

Notifications

Push permission is off

Keep alerts in view.

Your in-app notifications remain available. Enable device notifications if you also want push alerts.

In-app history

Available in FinEx

Open device settings

Not now

Flutter flow & behavior

Save independently

The alert rule can exist even if push permission is denied. Keep the in-app history authoritative.

Permission timing

Explain the benefit when the user enables push. Use the actual OS permission flow, not a simulated consent toggle.

Permission changes

Recheck device permission on return from settings. Show accurate state without repeatedly interrupting the user.

Notification routing

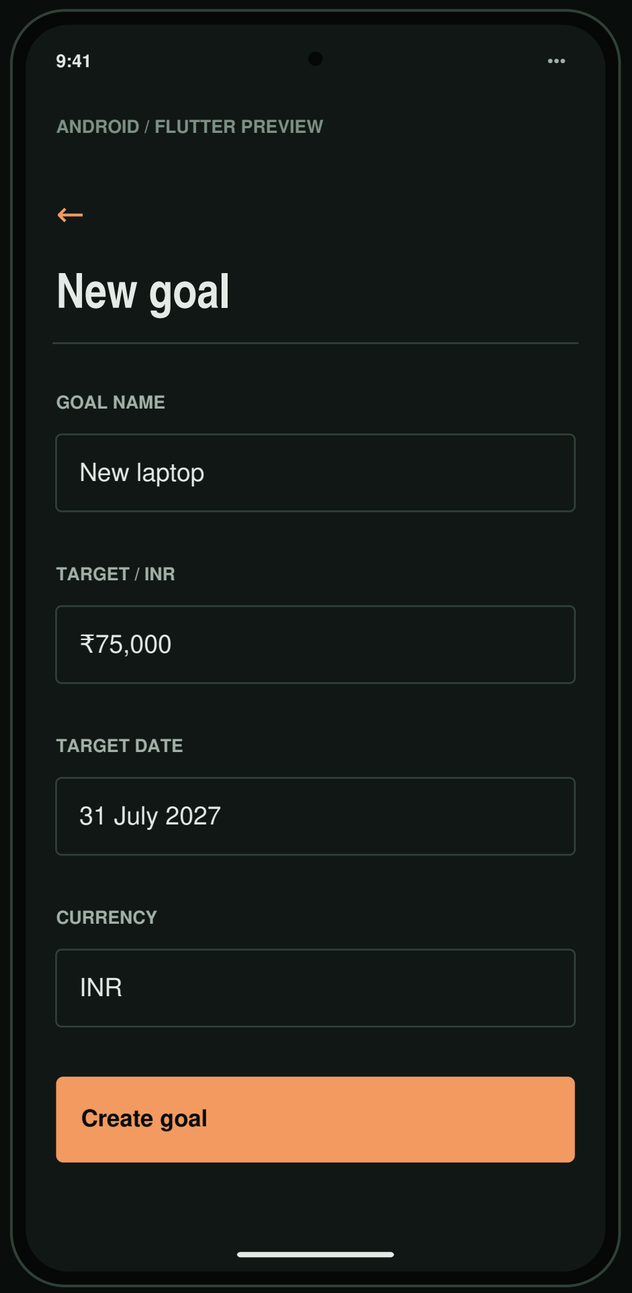

Open the correct private alert after session validation. Respect deduplication, cooldowns and read/unread status.

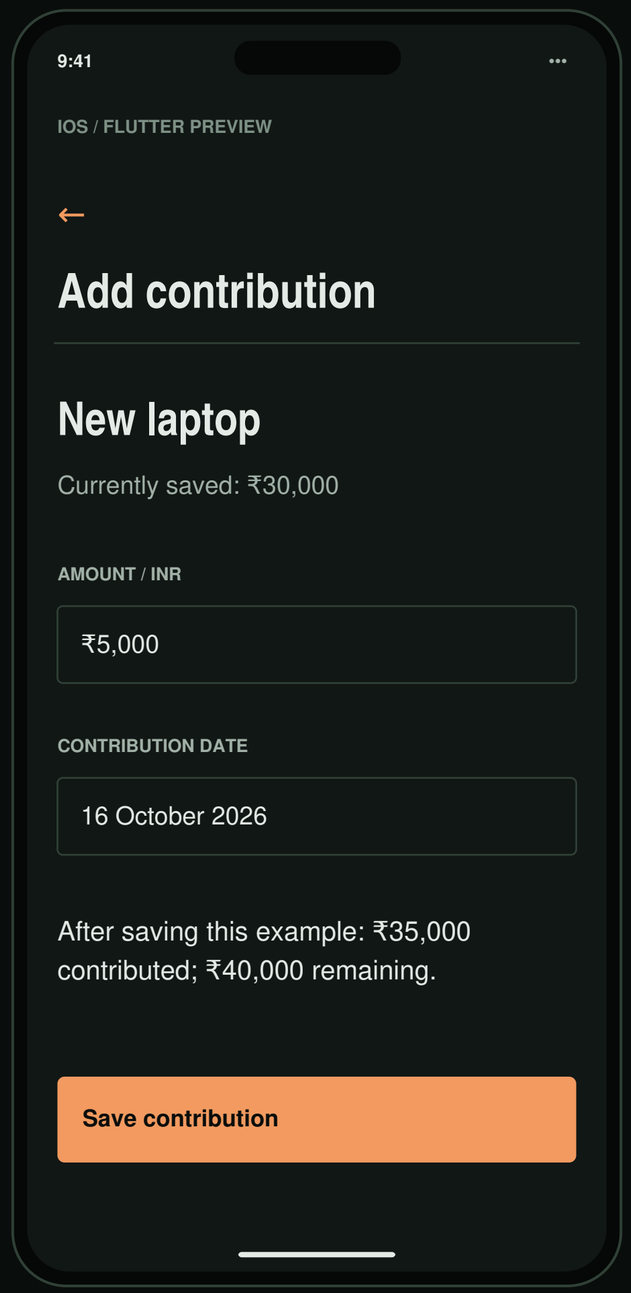

DESIGN The device-permission screen is an app explanation; the operating system supplies its own permission dialog.

BEHAVIOR Do not remove alerts when push delivery fails or request unrelated permissions for financial features.

Flutter goal forms & contributions

Create / edit / currency / target date / contribution history

Flutter flow & behavior

Create and edit

Validate name, positive target amount, currency and date. Keep the user's entries when the server returns an error.

Date selection

Use an appropriate date picker. Render dates consistently and make the saved date explicit before confirmation.

Actual contribution

Save the contribution first, then refresh history and totals from the backend. Prevent duplicate taps.

Scenario separation

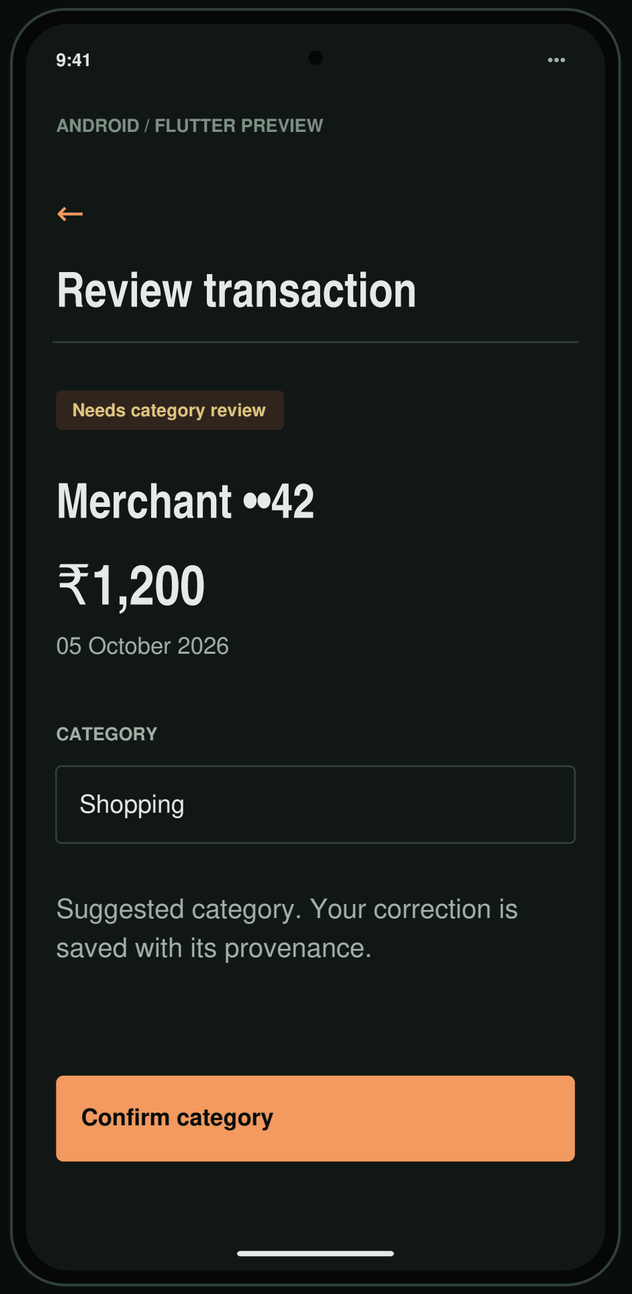

Monthly projections remain assumptions. Editing a projection does not create a real contribution or change ledger history.

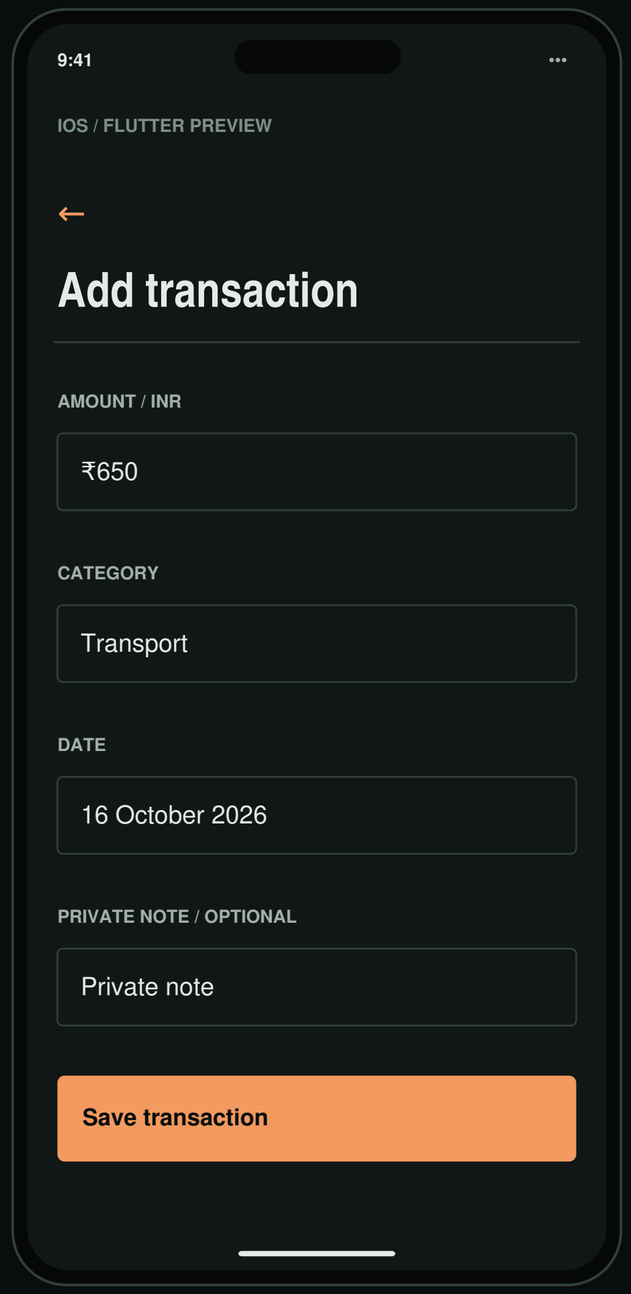

DESIGN Mobile forms expose the same goal fields as the desktop. The target date and contribution dates here are illustrative.

BEHAVIOR A contribution is a tracked record in this project, not a bank transfer initiated by the mobile app.

Flutter transaction review & manual entry

Correction / provenance / amounts / privacy

Flutter flow & behavior

Review uncertain labels

Show the original masked description and the current category. Manual correction must be available before accepting an insight.

Manual entry

Validate amount, date, currency and transaction type. Do not mix income, refunds and transfers into spending totals.

Sensitive descriptions

Keep notes private. Send only approved minimized or masked content to AI services, according to the project contract.

Save feedback

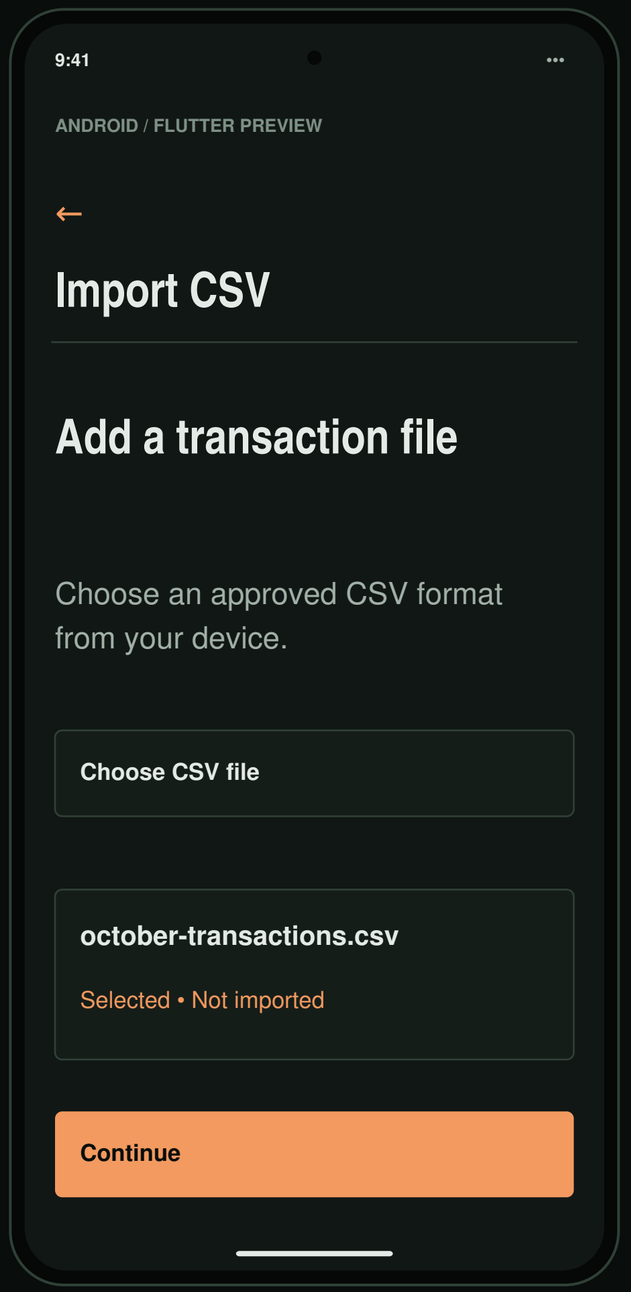

Show a success state tied to the saved record. Refresh reconciled totals and retain the original record provenance.

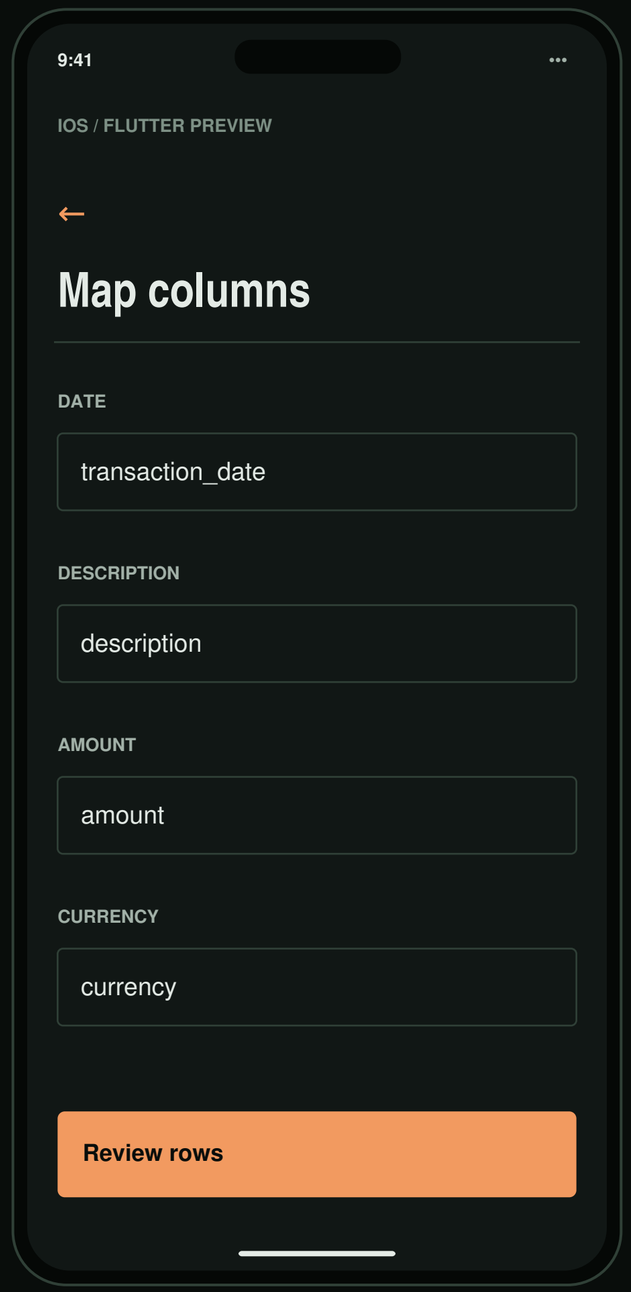

DESIGN A mobile correction is a first-class workflow. Users can inspect and fix classification without opening a spreadsheet.

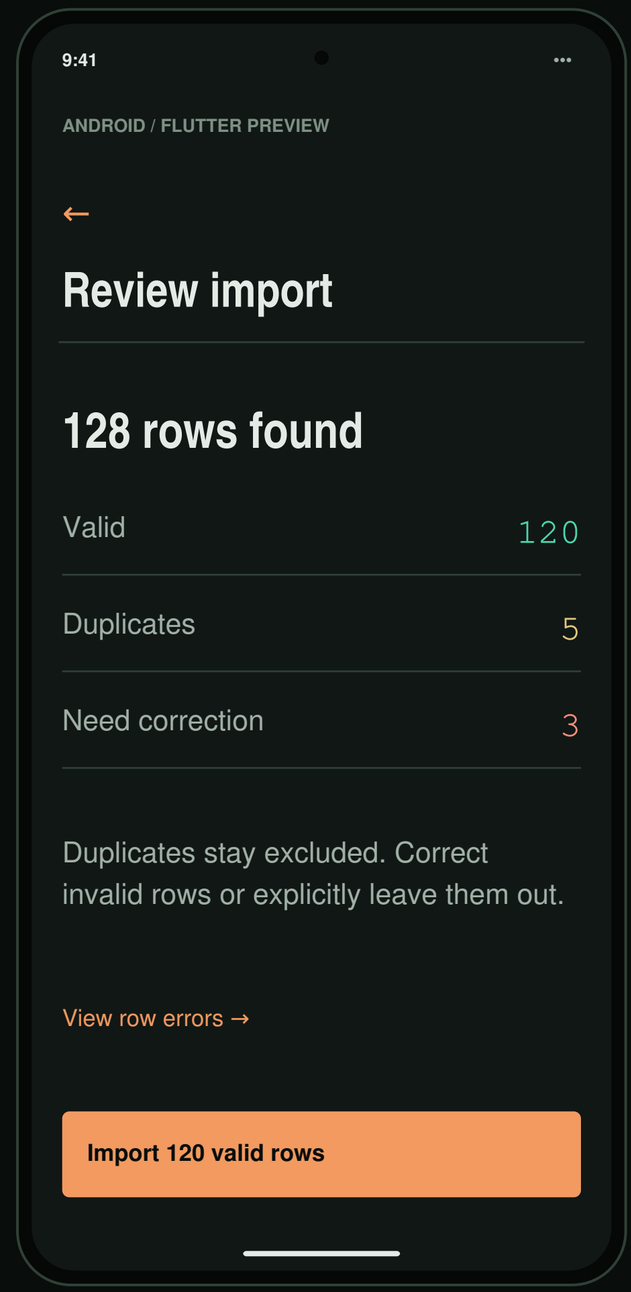

BEHAVIOR A model confidence score is not a promise of correctness; do not hide low-confidence classifications.

Flutter CSV selection, mapping & review

Use the native file picker, then an explicit preview before commit.

DESIGN Select a file, map its columns, inspect invalid/duplicate rows and then import. Never commit during preview.

BEHAVIOR Handle picker cancellation, unsupported files, upload interruption and duplicate import; show imported/skipped counts.

Flutter settings, privacy & sign-out

Profile / risk / consent history / device preferences

Privacy & consent

Your account details stay private.

Consent history →
Policy version and accepted time

Data-source permissions →
Review connected access

A sign-out confirmation should clearly explain what is removed from this device.

Back to settings

Flutter flow & behavior

Clear account boundary

Show the actual signed-in identity. On account change, remove sensitive cached state belonging to the previous user.

Consent visibility

Display actual accepted policy versions and timestamps from the backend. Do not fabricate a consent history.

Device preferences

Push permission and local preferences are separate from server notification rules. Keep both states understandable.

Sign-out behavior

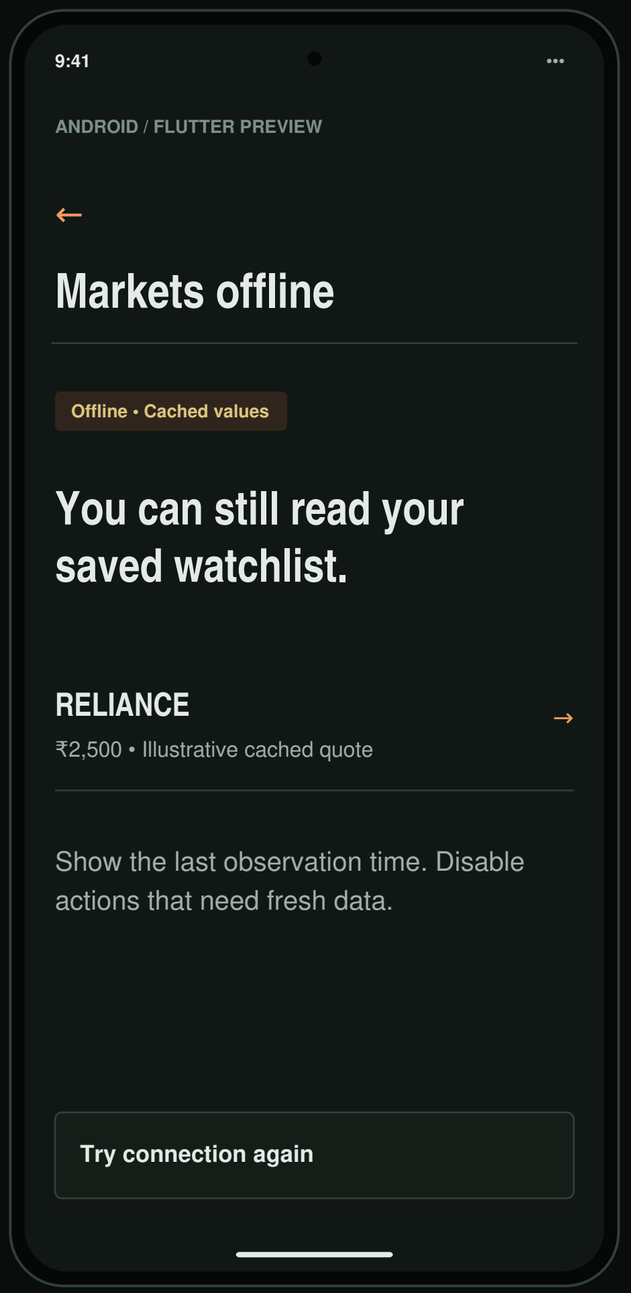

Stop protected requests, clear session secrets appropriately and return to sign-in. Do not erase server records as part of routine sign-out.

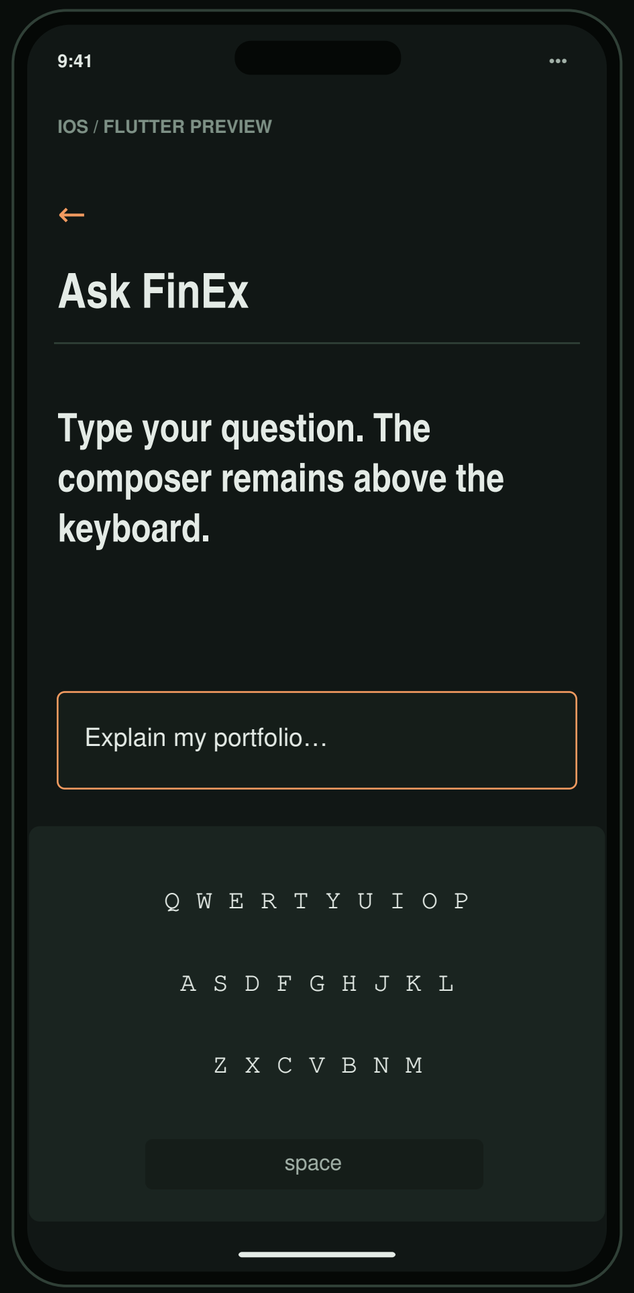

DESIGN Settings remain consistent with the desktop while making device-specific behavior explicit.

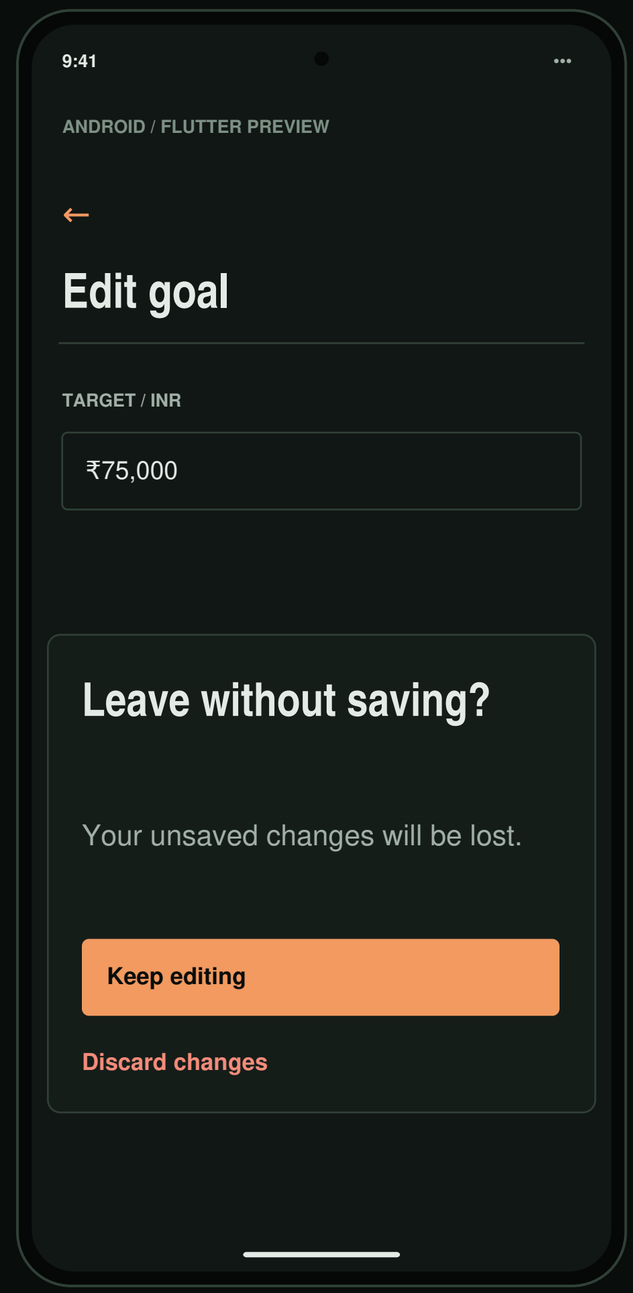

BEHAVIOR Only expose account deletion or data controls that the backend actually supports, with appropriate confirmation.

Flutter interruption & accessibility states

Offline access / keyboard-safe composer / unsaved changes

DESIGN Mobile screens must survive loss of connection, the on-screen keyboard, larger text and accidental Back navigation.

BEHAVIOR Use SafeArea and responsive insets [F1]. Respect platform navigation [F2]; do not trap the user in an uncloseable modal.

Flutter implementation & verification guide

Build the selected design as a real mobile client of the existing FastAPI backend.

Application structure & platform behavior

Shared design tokens

Centralize Graphite colors, typography, spacing, controls and status semantics. Reuse them across every mobile module.

Feature organization [F3]

Keep views and their presentation state separate from repositories and services. Suggested feature areas: auth, markets, portfolio, chat, trading, alerts, goals, spending and settings.

API & state

Reuse frozen OpenAPI Dart clients. The backend owns financial calculations and authorization. Handle loading, stale, error, pending and unknown states explicitly.

Platform adaptation [F1-F2]

Use SafeArea and available layout dimensions, handle keyboard insets and text scaling, and honor Android/iOS navigation conventions. Check app resume and session recovery.

Verification, deliverables & primary references

Required mobile evidence [F4]

Use widget checks for important visual and validation states, and integration tests for sign-in, watchlist, evidence reading, paper-order recovery and CSV preview/commit. Exercise Android and iOS where the required toolchain is available.

Deliverables for Shivraj

Provide Flutter source, environment setup, screenshots, test results and an Android build when verified. Report iOS build/signing status accurately. This PDF is a design guide, not an APK or a verified application build.

OFFICIAL FLUTTER REFERENCES / CHECKED 16 OCT 2026

F1 SafeArea & MediaQuery
https://docs.flutter.dev/ui/adaptive-responsive/safearea-mediaquery

F2 Platform adaptations
https://docs.flutter.dev/ui/adaptive-responsive/platform-adaptations

F3 App architecture
https://docs.flutter.dev/app-architecture/guide

F4 Testing Flutter apps
https://docs.flutter.dev/testing/overview

DESIGN — Preserve the existing Flutter project structure and dependency choices unless a concrete requirement justifies changing them.

BEHAVIOR — Do not claim device, store, signing, integration or test success without evidence. Keep the mobile visual direction under Shivraj’s control.

States that make the interface complete

Loading / empty / delayed / unavailable / insufficient evidence / uncertain order

01 / LOADING

Loading your holdings…

02 / EMPTY WATCHLIST

Start with one instrument.

Search for a company you would like to understand and add it to your watchlist.

Search instruments →

03 / DELAYED DATA

This quote is delayed.

Show the last observation time, provider and cached status. Keep its age visible.

Refresh quote →

04 / PROVIDER UNAVAILABLE

Market data is unavailable.

Your saved watchlist is still here. Retry the request without replacing missing prices with zero.

Try again →

05 / INSUFFICIENT AI EVIDENCE

I cannot verify that answer.

Choose a source or ask a narrower question. The assistant must not invent supporting information.

Choose a source →

06 / ORDER STATUS UNKNOWN

Checking your existing order.

Do not submit it again yet. Reconcile the order using its existing identifier.

Check order status →

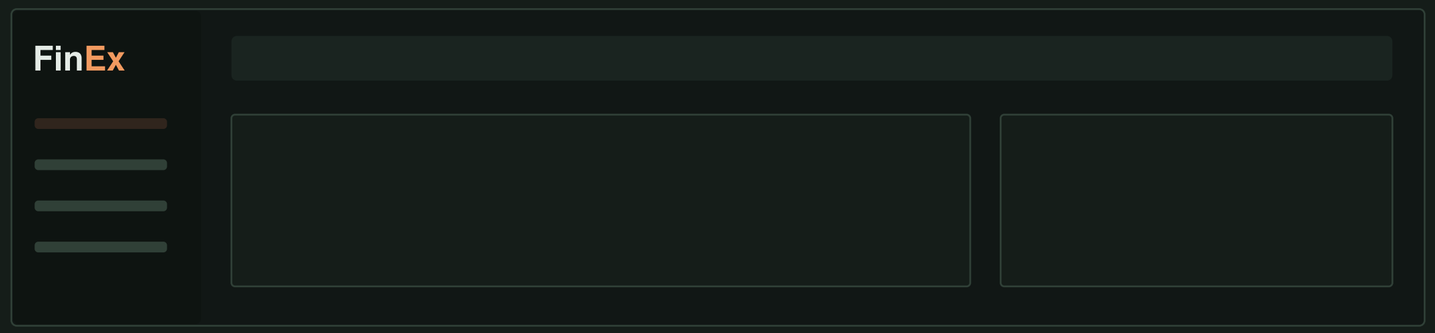

DESIGN Use task-specific language and a relevant next action. Financial values never appear as fabricated loading placeholders.

BEHAVIOR Announce state changes accessibly; preserve form input; prevent repeated destructive or financial submissions.

Responsive layout & accessibility

Desktop rail / tablet drawer / mobile tabs / readable density

Layout rules

DESKTOP / PROPOSED ■1200PX

Persistent side navigation. Central analytical workspace. Supporting watchlist or evidence panel appears when relevant. Keep numeric columns aligned.

TABLET / PROPOSED 768-1199PX

Collapse the side rail into a drawer. Stack secondary panels below the primary task. Avoid shrinking tables until columns become unreadable.

MOBILE / BELOW 768PX

Single column, labelled rows and four bottom tabs. Evidence opens in a sheet. Keep order review as a separate step.

Interaction & accessibility

Keyboard

Visible focus; logical tab order; Escape dismisses dialogs without losing input.

Touch & text

At least 48px mobile targets. Support text scaling and screen-reader labels.

Charts & color

Show units and data timestamps. Provide accessible values; pair color with signs or labels.

Motion

Brief state transitions only. Respect reduced motion; do not animate account totals as if live.

Validation

Associate errors with fields. Explain disabled actions. Confirm irreversible or financial actions.

DESIGN These breakpoints are proposed starting points. Validate them against real content and actual device widths.

BEHAVIOR Test at 360px and 1440px as required by the handbook, then cover tablet, zoom and long-label cases.

Real-data frontend rules

The visual theme must preserve the project’s data and safety contracts.

Market, portfolio & paper-trading data

Visible provenance

Display provider, currency, observation time and freshness. Retrieval time is separate. Cached data must not look live.

One financial truth

The backend calculates holdings, P&L, allocation, cash and projections. Web and mobile format the same values.

Paper trading only

Keep the virtual-account label visible. Show estimated and final prices separately; honor quote eligibility and fee rules.

Reliable order states

Use scoped idempotency, disable repeated submit, and reconcile pending/unknown requests. A timeout is not a rejected order.

AI, privacy & integration

Evidence-backed AI

Render structured answers and verified citations. Show the actual supporting passage and source metadata. Preserve uncertainty.

Private user data

All account records are user-scoped. Mask sensitive spending descriptions. Do not put provider or database keys into a client.

CSV & goal integrity

Preview before import; show invalid/duplicate rows. Separate goal contributions from hypothetical scenarios and display assumptions.

React + Flutter parity

Use generated TypeScript/Dart clients from frozen OpenAPI. Keep labels, errors and financial meanings consistent across platforms.

DESIGN These mockups use a consistent demonstration dataset for readability. They do not authorize production fixture data.

BEHAVIOR Use real permitted sources in the product. Synthetic values stay isolated to tests and clearly labelled design previews.

Instructions for Antigravity

Copy these instructions with this PDF and the project handbook.

Build FinEx using the selected Graphite Terminal theme.

Shivraj has selected the charcoal-and-orange visual direction shown in the reference image and this guide. Use this as the frontend design reference while preserving the full project handbook scope.

01 / INSPECT FIRST

Read the handbook, this visual guide and the existing repository. Reuse working components, routes and contracts. Report mismatches before altering business behavior.

02 / FOLLOW THE SELECTED DESIGN

Keep the charcoal surfaces, orange action/navigation color, green/red status signals, condensed headings, numeric alignment, compact tables and sidebar. Do not substitute a different theme.

03 / ASK ABOUT VISIBLE CHANGES

Shivraj controls frontend direction. The theme is selected; individual details remain reviewable. Ask before inventing a missing screen, redesigning an approved screen or making a visible tradeoff.

04 / USE REAL INTEGRATIONS

Connect React and Flutter to the shared FastAPI backend. Use generated clients and approved contracts. Do not ship the amounts, dates or chart series in this PDF as real user data.

05 / IMPLEMENT COMPLETE STATES

Include loading, empty, stale, error, disabled, success, pending and unknown states. Preserve inputs and context. Review shared states on page 39, mobile flows on pages 22-38 and order confirmation on pages 13-15.

06 / RESPECT FINANCIAL BOUNDARIES

Use backend calculations and ledger state. Paper trading is virtual only. AI explains approved values, shows evidence and never silently executes an order.

07 / VERIFY VISUALLY AND FUNCTIONALLY

Check desktop and mobile layouts, focus order, labels, contrast, large text and data alignment. Verify authenticated user isolation, validation, retries and order idempotency.

08 / WORK INCREMENTALLY

Implement one complete flow at a time. Show screenshots and working behavior for review. Continue backend/data work while visual decisions are pending. Report what was verified and what remains blocked.

DESIGN This brief approves use of the selected theme; it does not invent credentials, rules, APIs or completed implementation.

BEHAVIOR Read the full Flutter section on pages 22-38 as well as the project handbook. Resolve conflicts with Shivraj rather than silently changing scope.

Full screen index & delivery checklist

Find the matching visual before implementing a module.

Page map

Visual area	Pages	Sprint
Theme, tokens and navigation	01-03	S1
Login, onboarding and risk result	04-06	S2
Overview, markets, instrument and portfolio	07-10	S3
AI conversation and document evidence	11-12	S4 / S6
Paper ticket, review, receipt and activity	13-15	S5
Alerts and notification rules	16	S6
Goals, spending and CSV preview	17-20	S7
Profile, privacy and preferences	21	S2 / S8
Complete Flutter mobile flows + implementation	22-38	All
Interface states and responsive rules	39-40	S1 / S8
Data integration and Antigravity brief	41-42	All

What “ready for review” means

Design fidelity

The layout, color roles, type hierarchy and spacing match this direction.

Real behavior

Core flows connect to backend data with honest timestamps, states and errors.

Cross-platform parity

React and Flutter agree on financial values, labels, evidence and confirmation.

Review evidence

Provide screenshots, route coverage and a short record of verified behaviors.

Sources: your selected image(4).png; FinEx Combined Implementation Handbook v1.0, 10 Aug 2026. This is a visual specification, not proof of a deployed product.

DESIGN The guide covers the handbook’s core frontend modules, a 17-page Flutter section and the shared design behavior.

BEHAVIOR Review exact business rules, permissions and deployment gates against the master implementation plan.
